Deploying a Wi-Fi network and worried about the security of your wireless infrastructure? Between calling in the consultants and doing nothing, you might want to consider the SecPoint Portable Penetrator for penetration testing and wireless auditing of your network--all from one portable package. Sold as a laptop with the customized Linux-based SecPoint platform preinstalled, the Portable Penetrator draws into more than 42,000 signatures in order to test real exploits, and a plethora of SQL injection and cross scripting vectors to find weaknesses before hackers do. Results are presented in actionable reports while multiple daily updates from SecPoint mean that the database of tests are kept up-to-date. For more, see [the SecPoint site](#).
