

What is the benefit of Gateway Anti-Virus Scanning?

The SecPoint Protector is a unique Unified Threat Management (UTM) Appliance which includes very strong Anti-Virus scanning of all incoming and outgoing mail traffic. Multiple Anti Virus engines are used to scan **ALL** protocols going through the Protector – and in both directions, unlike most competitive products which typically scan only one or two protocols. The SecPoint technology provides **real-time bi-directional** scanning for all protocols so only clear traffic can pass and the other traffic is blocked

Which vendors are included and why?

SecPoint has chosen to work with the award winning Kaspersky Labs Anti-Virus vendor as our number one Anti-Virus Scanning Engine. Kaspersky Anti-Virus is multiple award winning software has proven itself over and over again to deliver the fastest antivirus database definitions. Kaspersky Lab's expert personnel monitor the virus situation around the world 24 hours a day. This ensures a rapid response to new viruses. A dedicated team of linguists releases updates to the signature database every 3 hours.

As a complementary Anti-Virus Scanning engine we are using ClamAV. ClamAV is a strong Open Source Anti Virus Vendor and proven in some cases to be able to catch viruses that commercial Anti-Virus vendors failed to register.

The Protector even has the option to add a third vendor to again more and more anti Virus checking protection.
